Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

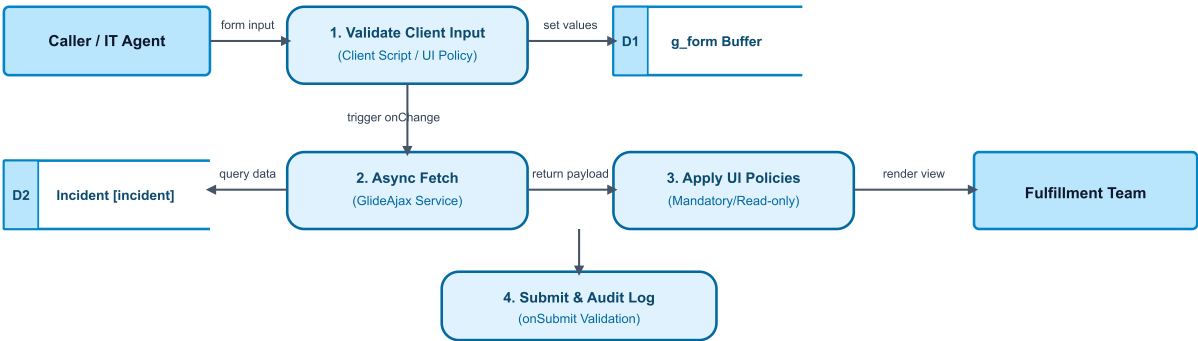

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Example: (Simplified Execution Flow)

1. User opens an Incident record or changes a field value (e.g., Category, State, Impact) on the Incident Form.
2. Client-side browser event triggers Client Scripts (`onLoad`, `onChange`, `onSubmit`) and UI Policy evaluation engine.
3. UI Policies dynamically set field mandatory states, visibility, and read-only flags on the active form view.
4. Client Script invokes asynchronous `GlideAjax` request passing parameters to server-side `Script Include`.
5. `Script Include` executes `GlideRecord` query against ServiceNow `incident` & `sys\_user` database tables and returns XML/JSON response to UI.

Example: DFD Level 0 (Industry Standard) - Incident Client Architecture

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
ITIL Fulfiller / Agent (Workspace User)	Client Scripting Automations	USN-1	As an ITIL Fulfiller, I want caller details (Location, Email, Manager) to auto-populate upon selecting a caller so that I do not manually enter user information.	Caller details are auto-filled instantly without full page refresh.	High	Sprint-1
		USN-2	As an ITIL Fulfiller, I want VIP callers to be visually highlighted on the Incident form so that critical user tickets are handled urgently.	VIP banner and icon display prominently when VIP caller is chosen.	High	Sprint-1
	UI Policy Rules & Actions	USN-3	As an ITIL Fulfiller, I want Resolution Code and Close Notes fields to remain hidden until the state changes to Resolved/Closed so that the form remains uncluttered.	Resolution fields appear dynamically only on state transition to Resolved.	Medium	Sprint-1
		USN-4	As an ITIL Fulfiller, I want Assignment Group and Assigned To fields to become mandatory for High/Critical incidents so that ownership is guaranteed.	Form prevents saving P1/P2 incidents if assignment fields are blank.	High	Sprint-1
Service Desk User (Portal User)	Form Validation & Control	USN-5	As a Portal User, I want subcategory choices to dynamically update based on my selected Category so that I only choose valid incident classifications.	Subcategory dropdown displays only relevant options for selected Category.	High	Sprint-1
		USN-6	As a Portal User, I want clear error messaging when attempting to submit an incident with missing mandatory fields so that I can correct errors immediately.	Client-side error banner points directly to missing fields before submit.	Medium	Sprint-2
	On-Hold Controls	USN-7	As a Portal User, I want Work Notes to become mandatory whenever an incident is placed On Hold so that the reason for delay is documented.	Form prompts for mandatory work notes when State = On Hold.	High	Sprint-2
System Administrator	Platform Security & Optimization	USN-8	As an Administrator, I want all closed incidents to become completely read-only for non-admin users so that historic records cannot be tampered with.	All form fields transition to read-only once state changes to Closed.	High	Sprint-1
		USN-9	As an Administrator, I want client-side scripts to execute asynchronously via GlideAjax so that form rendering performance is not degraded.	Form load time stays under 200ms with zero synchronous GlideRecord calls.	High	Sprint-2
