

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	30 September 2026
Team ID	6ab9453830f9767f8773c674
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Client Scripting Automations	onLoad Scripting: Automatically highlight VIP callers, auto-populate user contact details, and display real-time user banners on Incident form load. onChange Scripting: Dynamically adjust subcategories based on category selection and calculate impact/urgency priority values. onSubmit Validation: Mandatory field validation for Close Notes and Resolution Code before form submission. onCellEdit Validation: Prevent batch updates of Incident state to 'Closed' directly from list views without required resolution data.
FR-2	UI Policy Rules & Actions	Dynamic Field Visibility: Hide resolution fields until Incident state transitions to 'Resolved' or 'Closed'. Mandatory Controls: Dynamically set Assignment Group and Assigned To mandatory when priority is High/Critical (P1/P2). Read-Only Protection: Render all Incident fields read-only once the state changes to 'Closed'. Conditional Execution: Apply UI policies conditionally across both Web UI and Service Portal views.
FR-3	Asynchronous Server Integration	GlideAjax Execution: Retrieve caller details (Location, Manager, VIP status) asynchronously without blocking user interface interaction. Script Include API: Reusable server-side Script Include to validate configuration item (CI) maintenance windows.
FR-4	Incident Lifecycle Management Controls	State Transition Logic: Enforce mandatory work notes when placing an Incident on 'On Hold' with specific hold reasons. Child Incident Cascading: Validate and sync child incident states when major incident resolution occurs.

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Form interactions must be seamless, providing intuitive visual feedback, field highlighting, and immediate client-side error messaging without requiring page reloads. UI Policies must be prioritized over Client Scripts where possible to maintain zero-code user experience efficiency.
NFR-2	Security	All client-side data operations must adhere to ServiceNow Access Control Lists (ACLs). Client Scripts must not bypass data privacy policies or expose restricted fields via DOM manipulation. Secure g_scratchpad utilization for data transfer.
NFR-3	Reliability	Client scripts must include proper exception handling and null-checks to prevent JavaScript runtime errors that could disrupt form rendering or submission workflows.
