## Solution Architecture:

The solution architecture for **Implement Client Script & UI Policy (Incident)** defines how the ServiceNow Incident form, client-side automation, validation logic, and record submission work together. The design focuses on dynamic field behavior, consistent user interaction, and prevention of incomplete or incorrect Incident data.

- **Improve form behavior:** dynamically control Incident fields based on user actions and field values.
- **Guide data entry:** use UI Policies to manage field visibility, mandatory status, and read-only behavior.
- **Automate client-side actions:** use Client Scripts such as onChange and onSubmit to respond to form events.
- **Validate information:** prevent inappropriate or incomplete submission through client-side checks.
- **Maintain consistency:** ensure the Incident form behaves predictably during creation and update.
