

Project Design Phase Problem – Solution Fit Template

Date	30 September 2026
Team ID	6ab9453830f9767f8773c674
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Problem – Solution Fit

Problem-Solution Fit means identifying a real customer or user problem and ensuring that the proposed solution directly addresses that problem. For this project, the fit is established by connecting common Incident-form usability and data-quality issues with dynamic ServiceNow form behavior implemented through Client Script and UI Policy configuration.

Purpose

- ☐ Solve Incident-form problems in a way that fits the needs of service desk users.
- ☐ Improve solution adoption by using familiar ServiceNow form behavior and existing configuration mechanisms.
- ☐ Provide clear and consistent field behavior through appropriate triggers, conditions, and rules.
- ☐ Reduce frequent data-entry annoyances and improve the quality of Incident information.
- ☐ Understand the existing Incident-form situation and improve it for the target users.

Template – Project Specific Problem–Solution Fit

Parameter	Project Details
1. Target Users / Customers	Service desk agents, support technicians, and other users who create or update Incident records in ServiceNow.
2. Problem / Need	The Incident form may require better control of fields during data entry. Users can face unnecessary field visibility, mandatory-field, or read-only issues, which may lead to incomplete, inconsistent, or incorrect Incident information.
3. Existing Situation	Without suitable client-side rules, users may have to manually interpret which fields need attention. A static form does not always respond to changing Incident conditions, creating avoidable effort during Incident creation and updating.
4. Proposed Solution	Implement a Client Script and UI Policy on the Incident table. The Client Script handles required client-side actions when the form loads or relevant values change, while the UI Policy dynamically controls field visibility, mandatory status, or read-only behavior according to defined conditions.
5. Problem–Solution Fit	The solution directly maps dynamic Incident-form requirements to configurable ServiceNow behavior. When an Incident condition changes, the configured rules can automatically adjust the form instead of requiring users to manage the behavior manually.
6. Key Value / Benefits	Improved data-entry consistency, fewer avoidable form errors, clearer user interaction, reduced manual checking, and a more efficient Incident-management workflow.
7. User Adoption / Usability	The solution works within the existing ServiceNow Incident form, so users do not need a separate application or unfamiliar workflow. Dynamic field behavior can make the required actions clearer during normal Incident processing.
8. Expected Outcome	A more responsive and controlled Incident form that supports accurate information capture and consistent Incident handling while remaining configurable for future business requirements.
9. Scalability	The same approach can be extended to additional Incident fields and business rules and can also be adapted for other ServiceNow tables and forms where dynamic field behavior is required.
