Implement Client Script & UI Policy (Incident)

Project Title	Implement Client Script & UI Policy (Incident)
Date	30 September 2026
Team ID	6ab9453830f9767f8773c674
Team Lead	Anithashree tt
Team Member	Harani R
Team Member	Pooja N
Team Member	Sangeetha M

Project documentation format adapted from the supplied reference document, with all technology-specific content replaced by the provided ServiceNow project content.

1. Introduction

Project Title: Implement Client Script & UI Policy (Incident) is developed on the ServiceNow platform to improve the functionality and usability of the Incident form. The project uses Client Scripts and UI Policies to control client-side form behavior, perform field validation, and dynamically manage field properties such as mandatory, visible, and read-only states.

Team Members and Roles

- Anithashree tt – Team Lead
- Harani R – Team Member
- Pooja N – Team Member
- Sangeetha M – Team Member

2. Project Overview

Purpose: The purpose of the project is to implement Client Script and UI Policy configurations on the ServiceNow Incident form so that user interaction is controlled and appropriate information is entered before an Incident is submitted or updated.

Features:

- Client-side field validation
- Dynamic field behavior
- Mandatory field control
- Field visibility control
- Read-only field control
- Conditional UI behavior
- Improved Incident form usability
- Validation during Incident creation and update
- Proper handling of user input

3. Architecture

Platform: ServiceNow Cloud Dimensions DEV / Training Instance

Client-Side Configuration: Client Script is used to perform client-side validation and control Incident form behavior based on defined conditions.

User Interface Configuration: UI Policy is used to dynamically control field properties such as Mandatory, Visible, and Read-only.

Data Management: Incident records are created, updated, and managed within the ServiceNow Incident table.

Architecture Flow

User	→	Incident Form	→	Client Script / UI Policy	→	Field Validation & UI Behavior	→	Incident Record
------	---	---------------	---	---------------------------	---	--------------------------------	---	-----------------

4. Setup Instructions

Prerequisites

- ServiceNow account
- Access to the Cloud Dimensions DEV / Training Instance
- Appropriate permissions to configure Incident records
- Access to Client Scripts
- Access to UI Policies

Configuration / Installation Steps

1. Log in to the ServiceNow instance.
2. Navigate to the Incident module.
3. Open the Incident form.
4. Create and configure the required Client Script.
5. Define the appropriate Client Script type and conditions.
6. Create and configure the required UI Policy.
7. Define the UI Policy conditions.
8. Configure the required field properties.
9. Save the configurations.
10. Test the Incident form to verify the implemented functionality.

Client Script Configuration Evidence

The screenshot shows the ServiceNow Client Script configuration page. The form is titled 'Client Script' with the subtitle 'Auto set urgency for high impact'. The configuration details are as follows:

- Name:** Auto set urgency for high impact
- Table:** Incident [incident]
- UI Type:** Desktop
- Type:** onChange
- Field name:** (empty)
- Application:** Global
- Active:** ☒
- Inherited:** ☐
- Global:** ☒
- View:** (empty)
- Description:** (empty)
- Messages:** (empty)
- Script:**

```
function onChange(control, oldValue, newValue, isLoading) {
    if (isLoading || newValue == '') {
        return;
    }

    if (newValue == '1') {
        g_form.setValue('urgency', '1');
        g_form.addInfoMessage('Urgency set to High for High impact incident.');
```

5. Folder Structure

A traditional local folder structure is Not Applicable because the project is developed directly within the ServiceNow platform.

The relevant ServiceNow components are:

- Client Scripts
- UI Policies
- Incident Table
- Incident Form

6. Running the Application

- Log in to the ServiceNow Cloud Dimensions DEV / Training Instance.
- Navigate to All → Incident.
- Select Create New.
- Enter the required Incident information.
- Verify Client Script behavior.
- Verify UI Policy behavior.
- Check mandatory, visible, and read-only field properties.
- Submit or update the Incident.
- Verify that the Incident record is successfully created or updated.

Figure 3: Incident Form

7. API Documentation

Not Applicable.

The project does not implement a custom REST API, external backend API, or separate web service. The functionality is implemented using ServiceNow Client Scripts and UI Policies.

8. Authentication

Authentication is handled by the ServiceNow platform. Users must log in using valid ServiceNow credentials and must have appropriate permissions to access the Incident module and relevant configuration components.

9. User Interface

The main user interface is the ServiceNow Incident Form. The project focuses on controlling the form behavior and field interaction through the configured Client Script and UI Policy.

- Field validation
- Mandatory field behavior
- Visibility changes
- Read-only behavior
- Conditional field interaction
- Incident submission and update

10. Testing

The testing areas defined for the project are:

- Incident creation
- Incident update
- Client Script validation

- UI Policy condition
- Mandatory field behavior
- Field visibility
- Read-only behavior
- Form submission
- User interaction

The provided screenshots give configuration and Incident-list evidence. They do not independently establish successful end-to-end execution for every testing area; therefore, no broader testing-success claim is made beyond the supplied evidence.

11. Screenshots or Demo

The screenshots supplied for the project have been placed in the relevant sections according to what they demonstrate, rather than duplicated unnecessarily.

Project Demonstration Link

YouTube Demo Playlist: https://www.youtube.com/playlist?list=PLc_xloP2-0m8

The playlist contains the project demonstration videos showing the execution and functionality of the implemented ServiceNow Client Script and UI Policy.

12. Known Issues

The provided project materials do not document any major known functional issues. The supplied screenshots show the configured ServiceNow components and Incident results; no additional issue is asserted beyond that evidence.

13. Future Enhancements

- Implementing additional Client Scripts
- Adding more advanced UI Policies

- Introducing additional field validation
- Improving Incident form usability
- Adding more conditional field behavior
- Integrating additional ServiceNow automation features
- Implementing advanced Business Rules where required
- Extending the solution to other ServiceNow modules

Project Summary

The project demonstrates the implementation of client-side form behavior in ServiceNow using Client Scripts and UI Policies. The solution focuses on controlling Incident form interaction, validating user input, and dynamically managing field properties according to configured conditions.
